

Mountain Loghome

Log Houses, Post & Beam Houses, Element Houses

About us

Mountain Loghome have over 25 years of experience in manufacturing and constructing wooden houses. During that time, we have produced houses with very different solutions – dwelling houses, ski chalets, holiday cottages and saunas.

Thanks to our cooperation partners, we have a long-term experience in developing ski- and holiday resorts. We have produced and built cabin parks for ski centers in Norway and the Kingdom of Lesotho in Southern Africa. In addition, we have produced numerous office buildings, hotels and restaurants.

Besides Estonia, our main targeted markets are Norway, Germany, Austria, Switzerland, France and Japan.

In the production we use fully automatic CNC timber processing lines Hundegger 2Ki and Auer BL100A. Computer controlled production lines ensure preciseness and at the same time also faster delivery time.

We are a member of Estonian Chamber of Commerce and Industry, a founding member of Estonian Woodhouse Association and, from 2013, also a member of Japanese Log House Association. In 2013, Mountain Loghome was awarded with the title of Successful Estonian Company and credit rating AAA (exceptional) by the Krediidiinfo AS.

Post & Beam Houses

The idea of Post & Beam structures comes from old German Fachwerk houses that has now gained a new form – state-of-the-art architecture, design and materials. The innovative Post & Beam architecture is exciting and expressive. The laminated posts and beams connect big glazed surfaces or other wall elements by creating unique rooms for spacious and refulgent private residences, apartment buildings, offices or restaurants. This construction type can also be used for building warehouses, industrial- and agricultural buildings.

Log Houses

Living in a log house is natural and healthy – massive wooden wall accumulates and extracts heat and humidity and hence despite the season, there is always optimum climate indoors. As timber does not accumulate static electricity, there is less dust in log houses and breathing and living there is easier for people with allergies. Log houses are earthquake resistant and can also withstand big snow loads – the features that become vital when living in seismic zones or snowy conditions.

Drammen skicentre

Timber-frame Houses – Element Houses

Timber-frame houses are very common. Despite lower prices compared to other types of construction, it is possible to build a proper wooden house with very good thermal resistance. There are several ways for building a timber frame house. We produce pre-cut houses with kit of details cut to length and mortised in the factory and element houses, for which the structure elements (panels) are pre-fabricated and all you have to do on the site, is to assemble those elements.

Hundegger 2Ki is developed in Germany especially for producing of wooden and log houses. Currently the Hundegger 2Ki line is considered as the most flexible and economic one among the wood processing lines in the market. Auer BL100A is produced in Austria by Auer Technik. Like Hundegger, also Auer is a computer controlled.
